

INTERVAL LOOK-UP CHARTS

The interval look-up charts are intended as a further tool to assist in the development of a thorough understanding of the microtonal environments presented on this website: 24-, 48- and 19-div.

Using the charts, it is possible to look up intervals in *24 Microtonal Studies*, which are shown in their abbreviated form. The interval may then be pencil-marked in, a procedure which should be followed until interval-spotting becomes automatic.

The charts are particularly useful for those intervals which are difficult to identify at first sight. For example, B quarter-flat to D may register relatively quickly as a quarter-sharp minor third on the basis that B to D is a minor third and the quarter-flat widens that interval. On the other hand, C three-quarter sharp to E quarter-sharp may be harder to spot (as a minor third). For such intervals the charts provide verification and reassurance.

Intervals in 19-div are much easier to learn and recognize because many look, and are described, in exactly the same way as 12-div intervals. The chart may still be useful in the early stages, however, and is included for this reason.

USING THE CHARTS

The Interval Look-up Charts are presented in a form which allows for duplication and enlargement. They are presented in the order in which the divisions are presented (i.e. 24-; 48-; 19-div). As the A3-size files are too large for most domestic printers it is suggested that they are downloaded and by your local high-street printer for printing in these larger formats.
